

Securing the remote workforce

TrustBuilder®

Workers are no longer confined to fixed desks in an office. Over the years, they have turned into nomadic workers. Globally, 70% of people work remote at least one day a week, research finds. Wherever their workplace is, users will still want access to enterprise data and applications.

Workers are no longer full-time, contract employees. People commit to projects, not to companies, so organizations will always have a mix of employees, contractors and third-party employees that work in an open innovation mode.

Workers at remote locations don't have to pass a physical barrier, for instance access control to an office space. We need extra measures to make sure people are who they claim to be.

TrustBuilder Identity Hub is the ideal solution to let external workers gain access to those corporate applications and data to which they have rights. TrustBuilder Identity Hub combines adaptive security with user convenience.

— Allow workers to be productive...

- **SSO:** remote workers can log in to applications in exactly the same way they would log in when in the office – whether these applications are on-premise or (private) cloud-based.
- **Federated Authentication:** third party employees gain access to applications using the credentials of their own company.
- **BYOA/BYOD:** contractors or flex workers can continue using their own equipment (BYOD), or even their own authentication method of choice (BYOA – for instance Government ID, Microsoft or Google Authenticator,...) requiring no extra hardware.

...while retaining security for everyone involved...

- **ABAC:** attribute-based access control takes the context of the remote worker into consideration and offers more fine-grained access rights than VPN.
- **Step-up authentication:** access to sensitive data or applications will only be granted after additional authentication.
- **Orchestration:** a workflow editor connects different attributes and applies rules and policies in just a few clicks. As conditions evolve, changes can be made on the fly.
- **Central management:** TrustBuilder Identity Hub stores all knowledge on authentication, identification and authorization policies in a central place, eliminating the traditional spaghetti of connections.

...without excessive workload for the IT department.

- TrustBuilder Identity Hub is **highly configurable**, allowing complex integrations, but with a very short deployment time.
- TrustBuilder Identity Hub offers a **user-friendly interface**, making it easy to configure new connections and policies.
- TrustBuilder Identity Hub comes with **prebuilt connectors and templates**, cutting down development time.
- Third party employees are **managed by their own company**, so there's no difficult onboarding process nor a security risk when they leave their company.

— Peace of mind for everyone

Trust is essential in the open collaborative world we live in. Offering secure remote access while guaranteeing workers' productivity and preserving corporate assets is key in making employee and third-party collaboration successful.
